

One more progress towards Green Manufacturing .

Computer Control Burn In Chamber with Energy Recycle

We use a lot of energy in the burn-in process of our power electronic products for quality assurance in our manufacturing .

We will use this new burn-in chamber which recycles the burn-in energy back to the AC grid , up to 80% of electrical energy can be recycled .

There will be 70% less heat generated from the burn-in process ! less heat released to the environment and more saving on the factory air conditioning bills .

This computer control burn- in chamber is programmed to burn in our power electronic products , monitors and data log the burn- in records of products.
